Nota Bene:

5.1.23. No new SSH connections possible during upgrade

Although existing Secure Shell (SSH) connections should continue to work through the upgrade as usual, due to unfortunate circumstances the period when new SSH connections cannot be established is longer than usual. If the upgrade is being carried out over an SSH connection which might be interrupted, it's recommended to upgrade openssh-server before upgrading the full system.

Bien vu. Je confirme que la lecture de la Release est une étape importante à faire.

Voici ce que j'ai relevé :

- Exim <https://www.debian.org/releases/bullseye/amd64/release-notes/ch-information.en.html#idm1438>

```
Please consider the version of Exim in bullseye a major Exim upgrade. It introduces the concept of tainted data read from untrusted sources, like e.g. message sender or recipient. This tainted data (e.g. $local_part or $domain) cannot be used among other things as a file or directory name or command name.
```

```
This will break configurations which are not updated accordingly. Old Debian Exim configuration files also will not work unmodified; the new configuration needs to be installed with local modifications merged in.
```

...

- Security repository <https://micronews.debian.org/2021/1629045283.html>

```
For bullseye, the security suite is now named bullseye-security so users should adapt their APT source-list files and configuration accordingly when upgrading. More details on https://www.debian.org/releases/bullseye/amd64/release-notes/ch-information.en.html#security-archive #NewInBullseye #Debian11Bullseye
```

- Redmine <https://www.debian.org/releases/bullseye/amd64/release-notes/ch-information.en.html#redmine>

Moui mais celui-là concerne surtout le SI April.
