Quelques points relevés dans le fichier de release :

- <https://www.debian.org/releases/bullseye/amd64/release-notes/ch-information.en.html#security-archive>

5.1.3. Changed security archive layout

For bullseye, the security suite is now named bullseye-security instead of codename/updates and users should adapt their APT source-list files accordingly when upgrading.

The security line in your APT configuration may look like:

```
deb https://deb.debian.org/debian-security bullseye-security main contrib
```

If your APT configuration also involves pinning or `APT::Default-Release`, it is likely to require adjustments as the codename of the security archive no longer matches that of the regular archive. An example of a working `APT::Default-Release` line for bullseye looks like:

```
APT::Default-Release "/^bullseye(|-security|-updates)$/"
```

which takes advantage of the undocumented feature of APT that it supports regular expressions (inside `/`).

- <https://www.debian.org/releases/bullseye/amd64/release-notes/ch-information.en.html#ssh-not-available>

5.1.23. No new SSH connections possible during upgrade

Although existing Secure Shell (SSH) connections should continue to work through the upgrade as usual, due to unfortunate circumstances the period when new SSH connections cannot be established is longer than usual.

If the upgrade is being carried out over an SSH connection which might be interrupted, it's recommended to upgrade `openssh-server` before upgrading the full system.
